

Does the outdoor power supply have a protection mechanism

How does under voltage protection work?

Therefore the under voltage protection circuit has to wait until the power good signal is active to be turned on. This signal is generated by the monitoring integrated circuit or by the PWM controller (in the case of power supplies based on the half-bridge topology).

What are the different types of power supply protections?

[nextpage title="Introduction"] This is a sequel to our Anatomy of Switching Power Supplies tutorial and we are going to explore in depth all power supply protections like over voltage (OVP), under voltage (UVP), over current (OCP), over power (OPP), over load (OLP), over temperature (OTP), no-load operation (NLO) and also the power good signal.

What is the National Electrical Code (NEC) for outdoor wiring?

The National Electrical Code (NEC) includes many specific requirements for installation of outdoor circuits and equipment. With outdoor wiring, the primary safety concerns involve shielding against moisture and corrosion, preventing physical damage, and managing issues related to underground burial.

Why does a power supply have a signal?

This signal is available through pin eight (gray wire) from the main power supply connector. There is also another reason for this signal to exist: the under voltage protection (UVP). As we will see in the next page, the under voltage protection shuts down the power supply if the outputs have a voltage below a certain level.

What happens when you turn on a power supply?

When we first turn on the power supply, voltages are not immediately available on the power supply outputs: they increase until reaching their correct values. This increase happens in a fraction of a second (maximum of 20 ms or 0.02 s to be more exact).

Does the ATX12V specification require over voltage protection?

One interesting thing that most people don't know is that the ATX12V specification requires all PC power supplies to have over voltage protection (OVP) but the under voltage protection (UVP) is optional.
